

protradingtool

Features

Safer Automated Trading
Place both stop-loss and take-profit orders at the same time.

Trailing Stop-Loss
Never leave profits on the table by automatically increasing stop-losses once you've reached your initial take-profit.

Instant notifications
Javis, the Telegram bot sends you instant notifications for all automated actions. Direct to your phone or desktop.

Simple UI
Beautiful, simple and intuitive interface.

Trade anywhere
Web-based application for all devices. Trade on the go via your mobile, desktop or tablets devices.

Referral Bonuses
Earn recurring commission for referring new members.

1. Frequently Asked Questions

General

*** Can I try this before I buy it?**
Of course! Sign up for a 3-day free trial here.
<https://www.protradingtool.com/home/>

*** How do I contact you for help not listed here?**
Please read this guide first as most basic information is contained within.
Telegram
<https://t.me/joinchat/Fvxb2kXncpxK52QDds4bA>

Website
<https://protradingtool.com>

*** What Exchanges are currently supported?**
Binance and Bittrex.

*** Can this steal all my funds?**
When setting up your API on the exchange, do **not** allow it to 'Withdraw Funds'. This means the interface provided to the Pro Trading Tool by the exchange will not be allowed to withdraw any funds.

Notifications

*** How can I get notifications of my trades? And what is Javis?**
There is a Telegram notification bot (Javis) which can provide real-time notifications and information about your trades.
<https://telegram.org/>

After you have signed up for telegram, enter the Pro Trading Tools telegram (<https://t.me/joinchat/Fvxb2kXncpxK52QDds4bA>). Then send a message to either the Binance or Bittrex Javis bot and ' / start'

*** What commands are available through Javis?**
/list: Shows a full list of all current trades and parameters including Stop-Loss, Take-Profit, Step-Loss, Buy price, Current price and current profit percentage.
/list2: Shows a short list of all current trades with only the current profit percentage.
/check < ticker>: Shows the current price and volume of the chosen ticker.

*** How often does the tool update?**
Every few seconds, to avoid having your API banned by the exchange for high frequency requests. During peak periods on the exchanges, this may take slightly longer due to the exchange's response time.

*** What happens if I cancel the order set by the Pro Trading Tool manually in Binance/Bittrex?**
The entire automated order will no longer be available in the Pro Trading Tool and has to be re-set.

Stop-Loss and Take-Profit

*** My trade sold at a higher price than the Take-Profit value.**
Limit-Sell trades execute at the highest price available up to the set value.
Eg:
You set a limit-sell for 5 units at \$100.
There are 2 units available at \$102 and 10 units at \$100.
Result:
You will sell 2 units at \$102 and your remaining 3 units at \$100.
Javis notifies you on the actual average price which the trade executed at.

*** My trade sold lower than the Stop-Loss value.**
Your trade may have had the 'Fast Stop-Loss' option set. See section 4 in the guide.

*** My trade only sold a portion of my total or none at all during the Stop-Loss or Take-Profit.**
As sell orders are set at the exact price, there must be an equivalent buy order on the books to execute.
This issue generally occurs when there is a flash sale moving the price down very quickly, or when there is a price reversal exactly at your set price.
You can use the 'Fast Stop-Loss' (section 4) to avoid this, though it may be at a slightly lower price than the set value.
Eg: You set the Stop-Loss or Take-Profit for 5 units at \$100. There is an order placed for 1 unit at \$100 thus triggering your order. The next highest price in the order book is \$98, and no new buy orders are placed for \$100.
Result in this case, while your limit has been hit, there are no new orders at, or above your price therefore your order will simply sit on the order book until it sells.

*** Error: Total amount of Take-Profit or Stop-Loss must be equal or greater to 0.002 BTC**
Binance requires all orders to have a minimum of 0.002 BTC value. If you have set an order for less than this, then the order can not be placed.
This includes 'Fast Stop-Loss'. If this is ticked, ensure the total sell is above 0.0029 BTC.

*** How do I only set only a Take-Profit or Stop-Loss without the other?**
There is currently no option for this. You can however set them at extreme levels e.g. 90% Stop-Loss or 200% Take Profit which is unlikely to execute.

Step-Profit (Trailing Stop-Losses)

*** How does this work?**
See section 5 in the below guide.

*** My Step-Profit was lower than the current value.**
The Pro Trading Tool can only check the current price once every few seconds to avoid overloading the exchange API limits. For very fast moving prices, flash moves or when the exchange APIs are slow, the Step-Profit price may be behind by a few seconds.

Licenses

*** Javis is showing this error "You have no order or your premium is expired."**
Ensure your payment for the current period has been received. Check your current Premium license end date here.
Binance: <https://binance.protradingtool.com/profile.php>
Bittrex: <https://protradingtool.com/profile.php>

Please contact us via telegram if you feel this is not up to date.

*** Do I have to pay for 2 licenses if I want to use both Bittrex and Binance?**
Yes

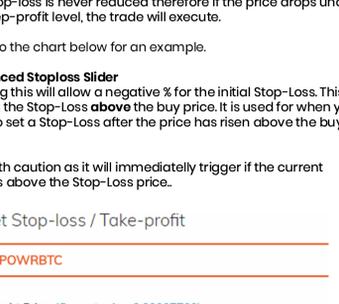

*** Can I have more than 10 active trades for each exchange?**
No

*** Can I create 2 accounts if I want more than 10 trades for each exchange?**
No

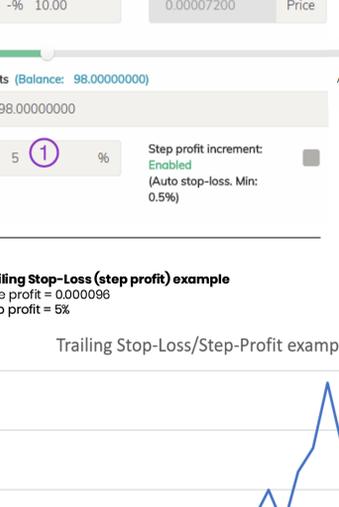

2. Access the Auto Trader

Login:
Binance: <https://binance.protradingtool.com/signin.php>
Bittrex: <https://protradingtool.com/signin.php>

This guide is based on the desktop version. The mobile version functions identically but is displayed in a mobile friendly format.

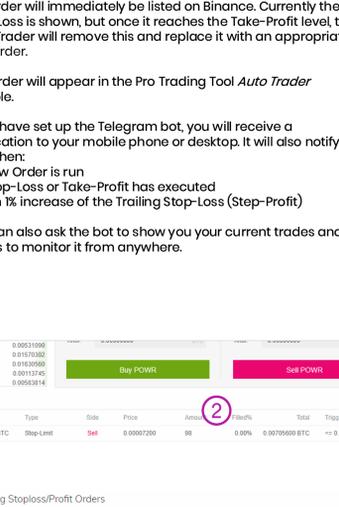

Navigate to the auto trader
Click on the "Auto Tool BTC" item in the left hand menu bar

3. Take-Profit

Select a coin
This is the coin which the stop-loss and take-profit actions will be applied to.

Note: You **must** have an unreserved balance of coins for it to display in this list. Any balance of coins currently in a pending stop-loss or take profit action can not be used until it is cancelled.

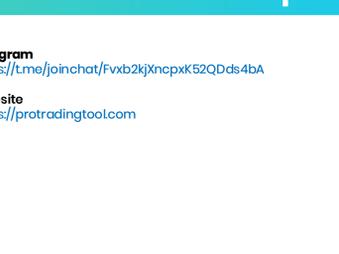

Enter a Take-Profit level
Upon reaching this price, the auto trader will sell these coins, unless trailing stop-loss/step-profit is selected.

1 The tool will attempt to guess the initial price the coins were purchased at. This is the **Bought Price**. Check that is the value you want to use as the base price for limit calculations. If not, change it.

2 The current price will be displayed in teal. Click on this to replace the bought price with the current price.

3 Enter your Take-Profit %
It is **relative** to the Bought Price provided. In this example, the bought price is 0.00008000, so the auto trader will take profit and sell at 20% above that, which is 0.00009600 (unless trailing stop-loss/step profit is ticked. This is explained in a section further down)

4. Stop-Loss

Enter a Stop-Loss level
Upon reaching this price, the auto trader will sell these coins at that price

1 Set the % price of the **Bought Price** that the Stop-Loss should be set.

2 The total available balance will be displayed in teal. Click on this to replace the current balance with the total balance or enter a custom amount.
Note: Any coins current used in another pending trade will not appear here.

3 **Fast Stop-Loss**
By selecting Fast Stop-Loss, the ask price is set to 70% of the Stop-Loss value. This provides a much higher chance the coin will sell.
This does **not** mean the coin will sell for 70% of your limit price, but it will sell to all bidders from the highest amount listed up to a maximum of 70%.

Fast Stop-Loss Sell
(sell rate lower than stop-loss 30% - recommended for full-filling the order in case price drops too fast)

For example:
I have 5 coins set to a Fast Stop-Loss limit of \$100.
When the price dips to \$100, my market ask price is set to \$70.
If the current Bid orders are as follows:

Price	Coins
\$100	1
\$98	2
\$96	2
\$88	1
\$75	3

Then even though the limit price is set to \$70 limit, I will still sell 1 coin at \$100, 2 coins at \$98 and 2 coins at \$96.

If I had not set the Fast Stop-Loss and the price is dipping fast I may only have sold 1 coin at \$100 with 4 more being unable to sell as there are no more buyers and the price has not risen back to \$100.

Note: All minimum order values must be more than 0.001 btc on Binance even for limit stop-loss. If you have a fast stop-loss on a small order, ensure the total amount after calculation still exceeds 0.001 btc or the order can not be placed.

5. Trailing Stop-Loss (Step-Profit)

1 **Setting Trailing Stop-Loss (step profit) to maximise profit**
If step profit is enabled, instead of selling at the Take-Profit value, a stop-loss will be set at the configured % under the current price.

Every 1% increase of price, this Stop-Loss will also be raised by 1%.

The stop-loss is never reduced therefore if the price drops under the step-profit level, the trade will execute.

Refer to the chart below for an example.

2 **Advanced Stoploss Slider**
Clicking this will allow a negative % for the initial Stop-Loss. This will set the Stop-Loss above the buy price. It is used for when you wish to set a Stop-Loss after the price has risen above the buy price.

Use with caution as it will immediately trigger if the current price is above the Stop-Loss price.

Trailing Stop-Loss (step profit) example
Take profit = 0.000096
Step profit = 5%

Trailing Stop-Loss/Step-Profit example

6. Execute action

1 **Save and run Order**

1 Click Save to run the Order.
Note: All minimum order values must be more than 0.002 btc on Binance even for limit stop-loss. So if you have fast stop-loss on a small order, ensure the total amount (e.g. 0.0029) after calculation still exceeds 0.002 btc or the order won't be placed.

2 The order will immediately be listed on Binance. Currently the Stop-Loss is shown, but once it reaches the Take-Profit level, the Auto Trader will remove this and replace it with an appropriate new order.

3 This order will appear in the Pro Trading Tool Auto Trader console.

4 If you have set up the Telegram bot, you will receive a notification to your mobile phone or desktop. It will also notify you when:
* A new Order is run
* A Stop-Loss or Take-Profit has executed
* Each 1% increase of the Trailing Stop-Loss (Step-Profit)

5 You can also ask the bot to show you your current trades and orders to monitor it from anywhere.
